

# statsExpressions: R Package for Tidy Dataframes and Expressions with Statistical Details

# Indrajeet Patil<sup>1</sup>

1 Center for Humans and Machines, Max Planck Institute for Human Development, Berlin, Germany

# **Summary**

The statsExpressions package has two key aims: to provide a consistent syntax to do statistical analysis with tidy data, and to provide statistical expressions (i.e., a preformatted in-text statistical result) for plotting functions. Currently, it supports common types of statistical approaches and tests: parametric, nonparametric, robust, and Bayesian t-test, one-way ANOVA, correlation analyses, contingency table analyses, and meta-analyses. The functions are pipe-friendly and compatible with tidy data.

# Statement of need

Statistical packages exhibit substantial diversity in terms of their syntax and expected input and output data type. For example, some functions expect vectors as inputs, while others expect dataframes. Depending on whether it is a repeated measures design or not, functions from the same package might expect data to be in wide or tidy format. Some functions can internally omit missing values, while other functions error in their presence. Furthermore, the statistical test objects returned by the test functions might not have all required information (e.g., degrees of freedom, significance, Bayes factor, etc.) accessible in a consistent data type. Depending on the specific test object and statistic in question, details may be returned as a list, a matrix, an array, or a dataframe. This diversity can make it difficult to easily access all needed information for hypothesis testing and estimation, and to switch from one statistical approach to another.

This is where statsExpressions comes in: It can be thought of as a unified portal through which most of the functionality in these underlying packages can be accessed, with a simpler interface and no requirement to change tidy data format.

# Comparison to Other Packages

Unlike broom (Robinson, Hayes, & Couch, 2021) or parameters (Lüdecke, Ben-Shachar, Patil, & Makowski, 2020), the goal of statsExpressions is not to convert model objects into tidy dataframes, but to provide a consistent and easy syntax to carry out statistical tests. Additionally, none of these packages return statistical expressions.

# **Tidy Dataframes from Statistical Analysis**

The package offers six primary functions that let users choose a statistical approach without changing the syntax (i.e., by only specifying a single argument). The users are always expected to provide a dataframe in tidy format (Wickham et al., 2019), and all functions work with missing data. Moreover, they always return a dataframe that can be further utilized downstream in the workflow (for a visualization, e.g.).

**Table 1:** A summary table listing the primary functions in the package and the statistical approaches they support. For a more detailed description of the tests and outputs from these functions, the readers are encouraged to read vignettes on the package website: <a href="https://indrajeetpatil.github.io/statsExpressions/articles/">https://indrajeetpatil.github.io/statsExpressions/articles/</a>.

| Function          | Parametric   | Non-parametric | Robust       | Bayesian     |
|-------------------|--------------|----------------|--------------|--------------|
| one_sample_test   | <b>√</b>     | <b>√</b>       | <b>√</b>     | <b>√</b>     |
| two_sample_test   | $\checkmark$ | $\checkmark$   | $\checkmark$ | $\checkmark$ |
| oneway_anova      | $\checkmark$ | $\checkmark$   | $\checkmark$ | $\checkmark$ |
| corr_test         | $\checkmark$ | $\checkmark$   | $\checkmark$ | $\checkmark$ |
| contingency_table | $\checkmark$ | $\checkmark$   | -            | $\checkmark$ |
| meta_analysis     | $\checkmark$ | -              | $\checkmark$ | $\checkmark$ |

statsExpressions internally relies on stats package for parametric and non-parametric (R Core Team, 2021), WRS2 package for robust (Mair & Wilcox, 2020), and BayesFactor package for Bayesian statistics (Morey & Rouder, 2020). The random-effects meta-analysis is carried out using metafor (parametric) (Viechtbauer, 2010), metaplus (robust) (Beath, 2016), and metaBMA (Bayesian) (Heck et al., 2019) packages. Additionally, it relies on easystats packages (Ben-Shachar, Lüdecke, & Makowski, 2020; Lüdecke, Ben-Shachar, Patil, & Makowski, 2020; Lüdecke, Ben-Shachar, Patil, Waggoner, & Makowski, 2021; Lüdecke, Waggoner, & Makowski, 2019; Makowski, Ben-Shachar, & Lüdecke, 2019; Makowski, Ben-Shachar, Patil, & Lüdecke, 2020) to compute appropriate effect size/posterior estimates and their confidence/credible intervals.

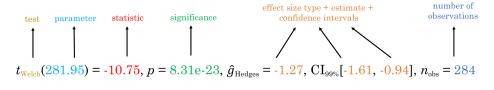

To illustrate the simplicity of this syntax, let's say we want to run a one-way ANOVA. If we first run a non-parametric ANOVA and then decide to run a robust ANOVA instead, the syntax remains the same and the statistical approach can be modified by changing a single argument:

```
mtcars %>% oneway_anova(cyl, wt, type = "nonparametric")
#> # A tibble: 1 x 14
#>
     parameter1 parameter2 statistic df.error
                                                     p.value
#>

```

These functions are also compatible with other popular data manipulation packages (see Appendix for an example).

#### Template for Frequentist analysis

#### Template for Bayesian analysis

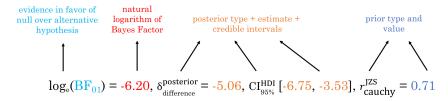

Figure 1: The templates used in 'statsExpressions' to display statistical details in a plot.

# **Expressions for Plots**

In addition to other details contained in the dataframe, there is also a column titled expression, which contains a pre-formatted text with statistical details. These expressions (Figure 1) attempt to follow the gold standard in statistical reporting for both Bayesian (Doorn et al., 2020) and Frequentist (American Psychological Association and others, 2019) frameworks.

This expression be easily displayed in a plot (Figure 2). Displaying statistical results in the context of a visualization is indeed a philosophy adopted by the ggstatsplot package (Patil, 2021), and statsExpressions functions as its statistical processing backend.

# Licensing and Availability

statsExpressions is licensed under the GNU General Public License (v3.0), with all source code stored at GitHub. In the spirit of honest and open science, requests and suggestions for fixes, feature updates, as well as general questions and concerns are encouraged via direct interaction with contributors and developers by filing an issue while respecting *Contribution Guidelines*.

# Acknowledgements

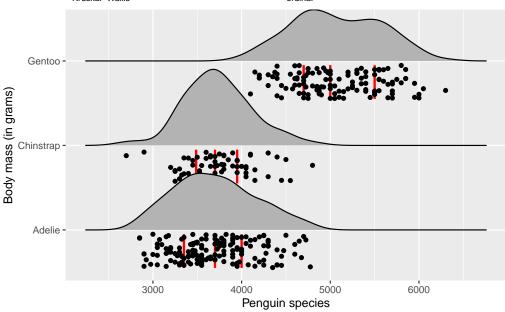

I would like to acknowledge the support of Mina Cikara, Fiery Cushman, and Iyad Rahwan during the development of this project. statsExpressions relies heavily on the easystats ecosystem, a collaborative project created to facilitate the usage of R for statistical analyses. Thus, I would like to thank the members of easystats as well as the users.
